

## Kerbing Systems

The Kerblin range provides a hygienic, durable and low maintenance kerbing solution, suitable for use in food-grade environments.

Made from high quality stainless steel in our state-of-the-art facility, all Kerblin products are designed by our in-house engineers and manufactured in the UK.

In addition to a wide range of off the shelf options, we offer a bespoke design service, enabling us to customise and create products to meet any customer requirements.

## Maintenance

Stainless steel equipment should be routinely checked for concentrated fluid build up, retained deposits and damage as these can lead to corrosion. If required, we are able to provide planned preventative maintenance programmes and inspections to ensure that kerbing systems are in optimal operating condition.

## Cleaning

All of our kerbing is designed to be easy to clean and maintain. The recommended cleaning methods include; steam, water, non-abrasive scrubbing, organic solvents and mild detergents. The frequency and specific cleaning method used will depend on the application of the kerbing. All kerbing should be routinely checked for damage.

## Installation

Our dedicated installation team are capable of undertaking projects of any scale with assistance and expertise provided at every stage of the project. All installations adhere to our industry leading service standards, are handed over ready to use and include a high quality finish with welded and polished joints and commissioning included. Installation services are available on all product ranges and bespoke products.

## Additional options

A range of tiled or screed flooring can be recommended to compliment this kerbing.

To discuss a project, or bespoke design requirement, contact our technical sales department.
